

BITCOIN PROTOCOL AND CONSENSUS: A HIGH LEVEL OVERVIEW

Max Fang & Viget

TERMINOLOGY

BLOCKCHAIN FUNDAMENTALS

Bitcoin is the technology that started it all

- Bitcoin is a cryptocurrency

Blockchain is the technology underlying Bitcoin

- Enables distributed consensus

Community terminology

- "crypto", "cryptocurrency" - Bitcoin, Ethereum, more technical
- "private blockchains", "permissioned ledgers", or just "blockchain"
- "distributed tech" or "decentralized tech" - umbrella term

BITCOIN AND CONSENSUS

Blockchain fundamentals

Bitcoin is the technology that started it all

- Bitcoin is a cryptocurrency

Blockchain is the technology underlying

Bitcoin: Enables distributed consensus

Community terminology

- "crypto", "cryptocurrency" - Bitcoin, Ethereum, more technical
- "private blockchains", "permissioned ledgers", or just "blockchain"
- "distributed tech" or "decentralized tech" - umbrella term

SATOSHI NAKAMOTO'S INNOVATION

BLOCKCHAIN FUNDAMENTALS

Bitcoin was created by Satoshi Nakamoto in 2009

- Decentralized, trustless system for transactions
 - A low cost financial system that only requires an internet connection
- Nakamoto solved the Double Spending problem
 - Prevent someone from spending the same asset twice
 - Solution? The blockchain + Proof-of-Work

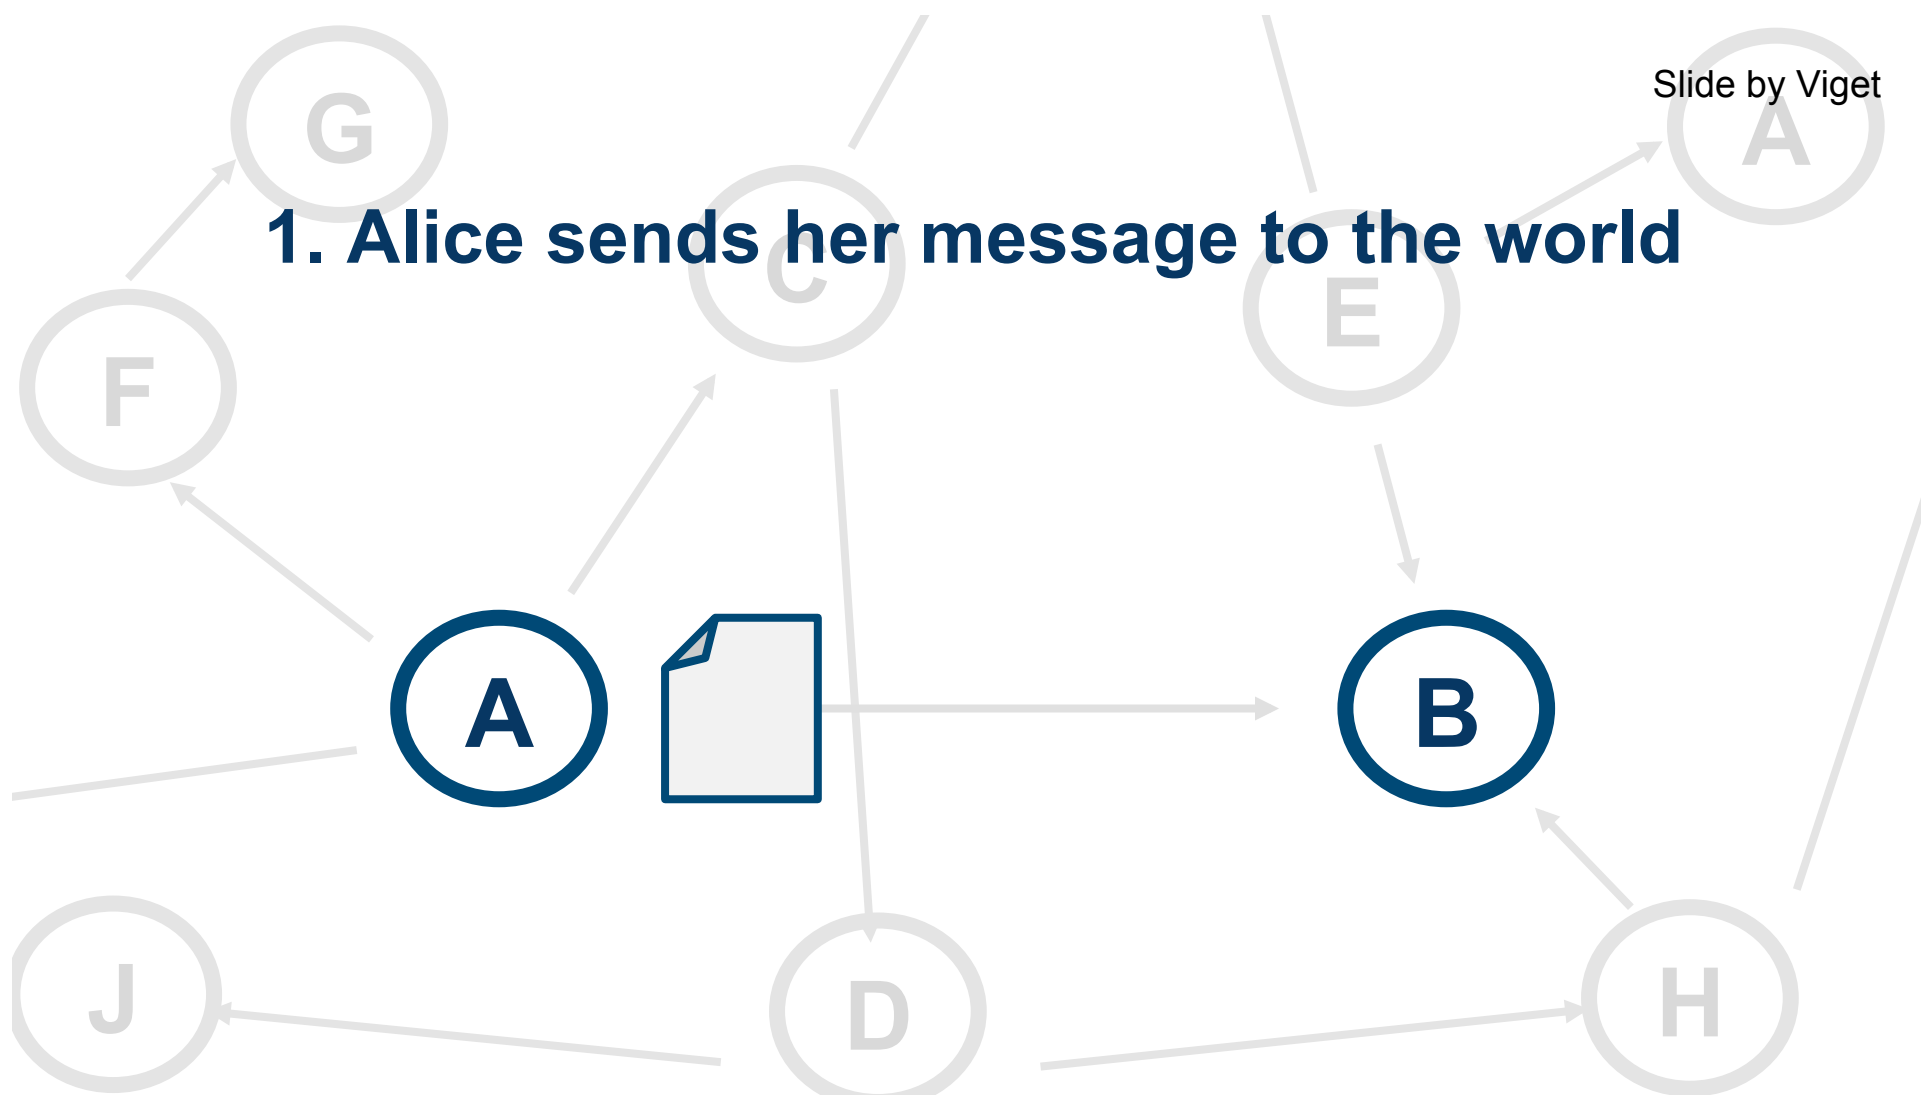

1. Alice writes and signs a message describing her transaction

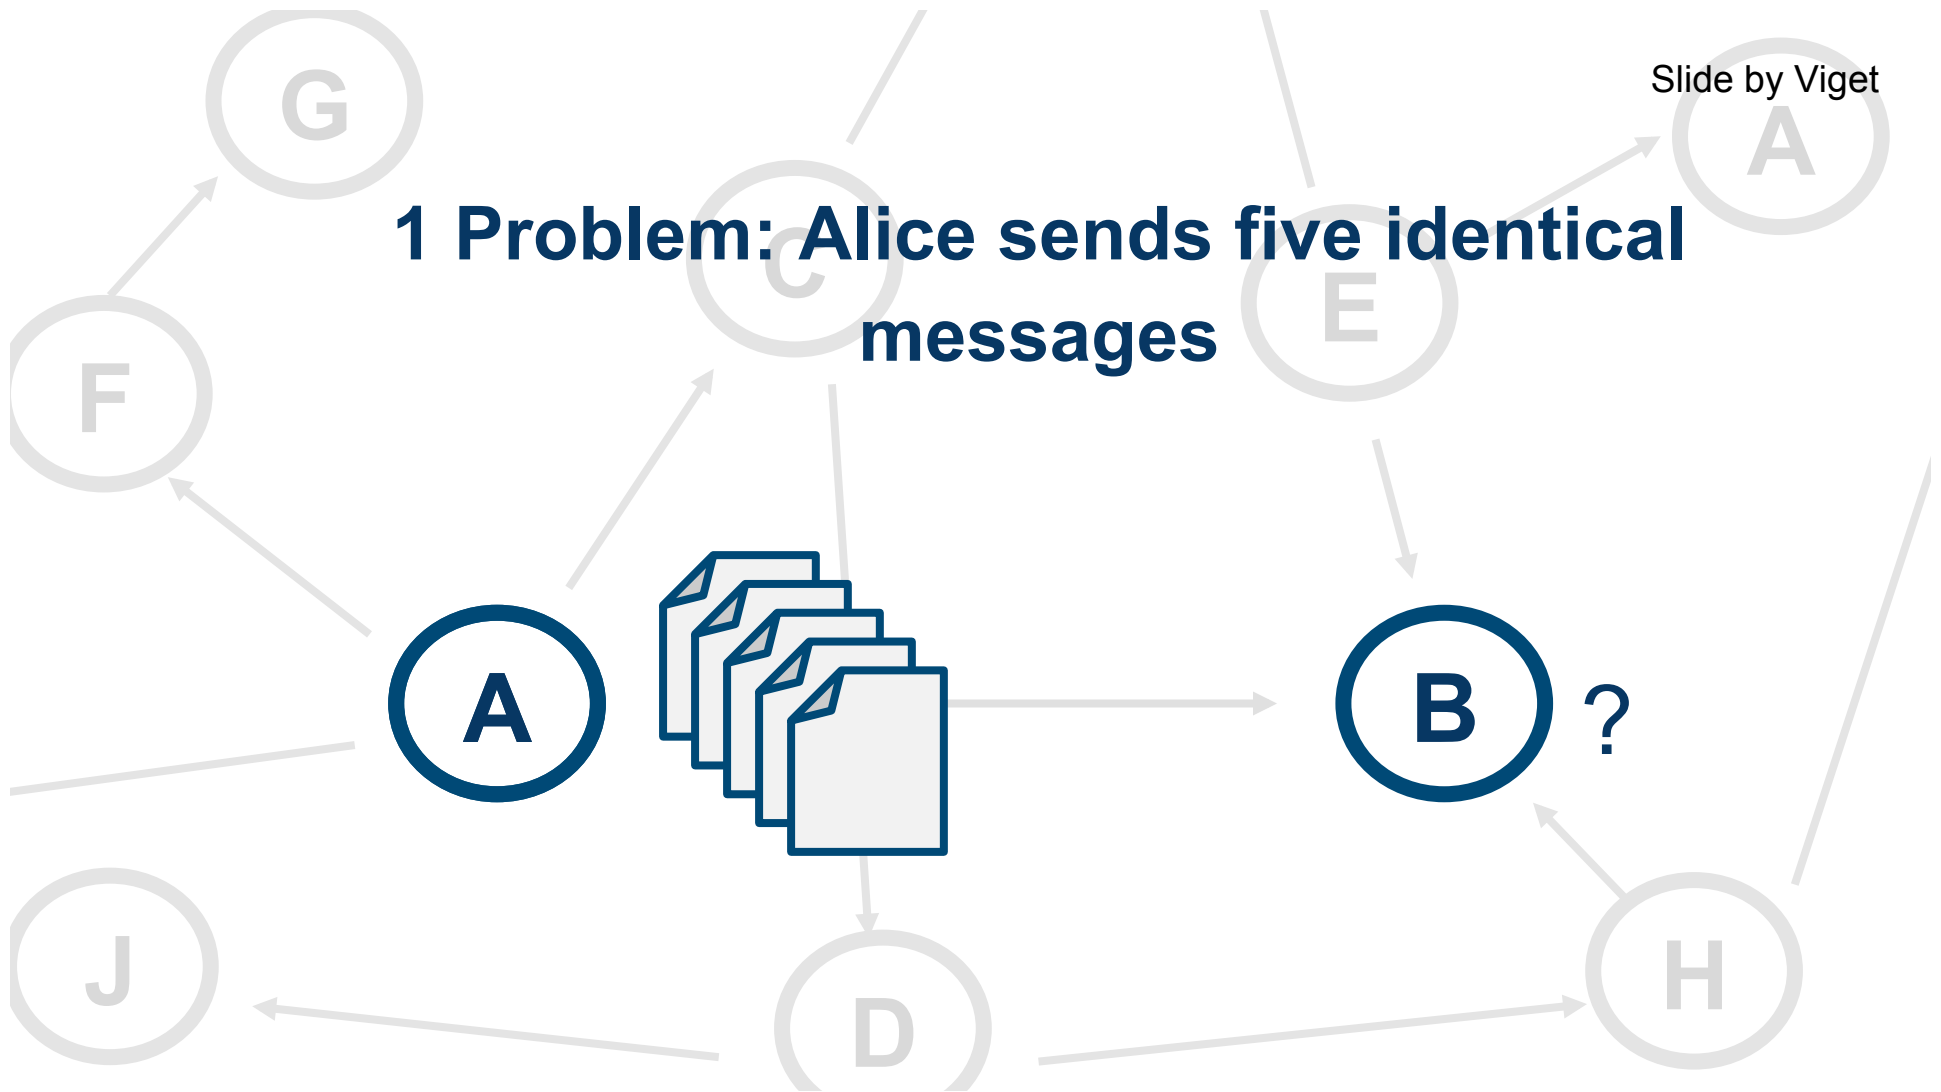

“I, Alice, am giving Bob one bitcoin.”

Slide by Viget

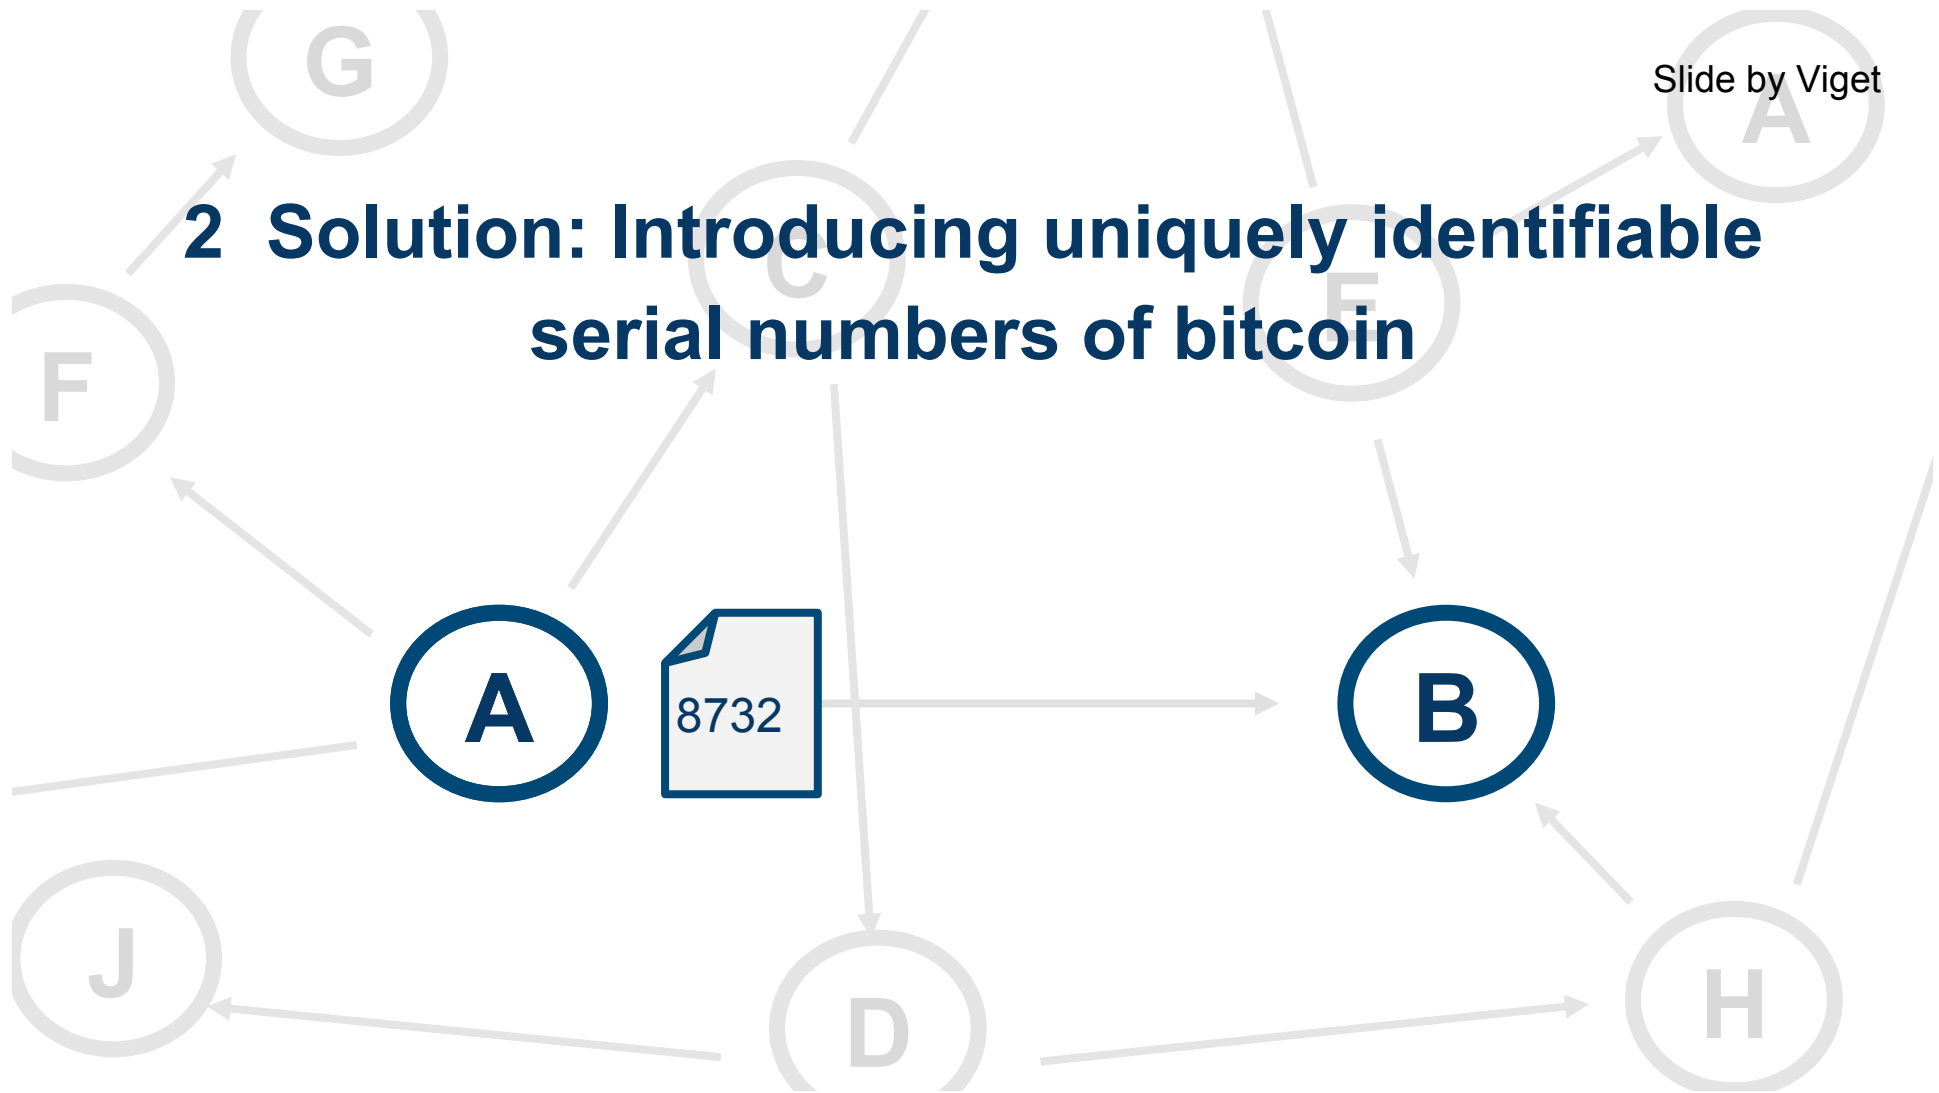

1. Alice sends her message to the world

1 Problem: Alice sends five identical messages

2 Solution: Introducing uniquely identifiable serial numbers of bitcoin

2 Where do serial numbers come from?

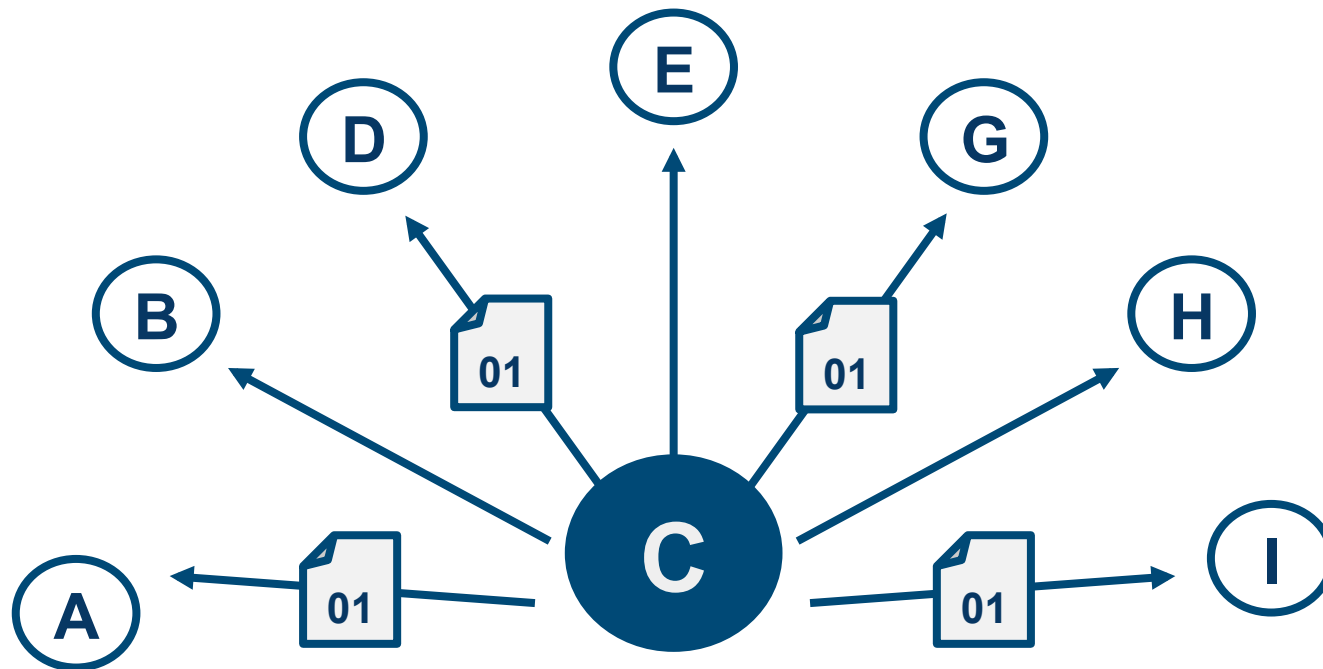

2 Usual solution (centralized):

A central bank manages transactions and balances each banknote has a serial number

2 Central bank: Centralization

3 Distributed: Making everyone the bank

Everyone has a complete record of transactions

3. Making everyone the bank

3.1 Alice sends her transaction to Bob

3. Making everyone the bank

3.2 Bob announces the transaction to the world

3. Making everyone the bank : Problem

3.3 Alice double spends on Bob and Charlie

3. Making everyone the bank

3.4 Everyone verifies transactions

A transaction is accepted if everybody accepts

3. Making everyone the bank

**3.4 Everyone verifies transactions therefore
Alice is prevented from double spending**

3. Making everyone the bank

3.5 Alice sets up multiple identities

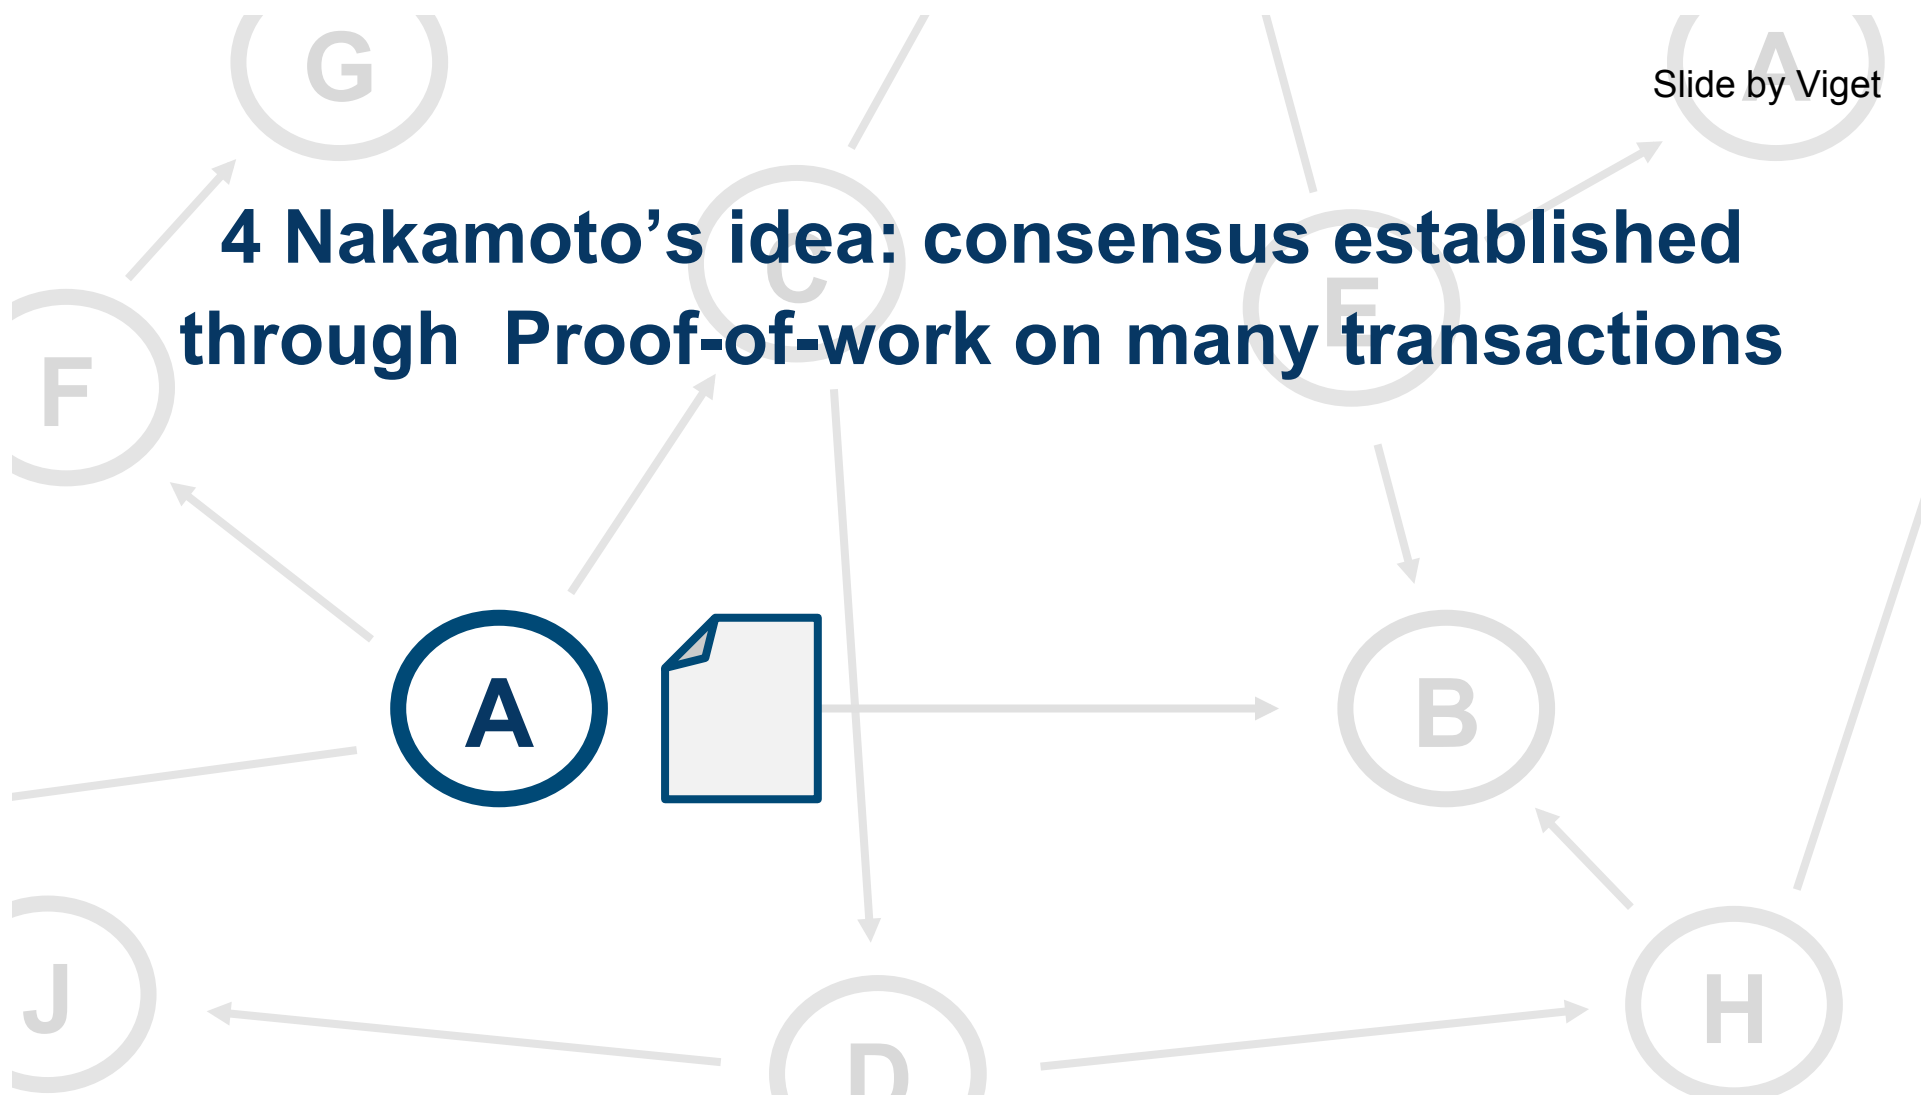

3.5 Alice double spends using multiple identities

Sybil Attack: Creating many fake identities to subvert a system

4 Nakamoto's idea: consensus established through Proof-of-work on many transactions

4.1 Block: verify a block of transitions

Many users add to list of pending transactions

Block: a set of transactions

1. I, Tom, am giving Sue one bitcoin, with serial number 3920.
2. I, Sydney, am giving Cynthia one bitcoin, with serial number 1325.
3. I, Alice, am giving Bob one bitcoin, with serial number 1234

All transactions since Bitcoin started are stroed using as data structures a list (chain) of blocks

4.1 Verifying transactions

**0 Form
block**

**1 Check
block is
correct**

**2 Solve
puzzle**

**3 Announce
block to all
users**

**4 users
verify
correctness**

**5 Nakamoto's idea:
Solve the puzzle using Mathematics
Why the math?**

5.1 Why the math?

We want to make it costly for Alice to double spends with her multiple identities

5.2 How is the math?

**Proof-of-work as a competition
who wins the competition is paid with Bitcoins**

5.2 Proof-of-work as a competition

- the winner is the first that solves a puzzle on the new block to be added to the blockchain
- the winner is paid with Bitcoins
- the rule of the game favour honest behaviour: there is an incentive to recognize the winner also for those that are not winner

Summary

	Major feature	Value added
1	Signed messages announced to the network	Basis of entire system
2	Serial numbers	Uniquely identifiable transactions
3	The block chain	Shared record of transactions
4	Everyone verifies transactions	Increased security
5	Proof-of-work	Prevents double spending

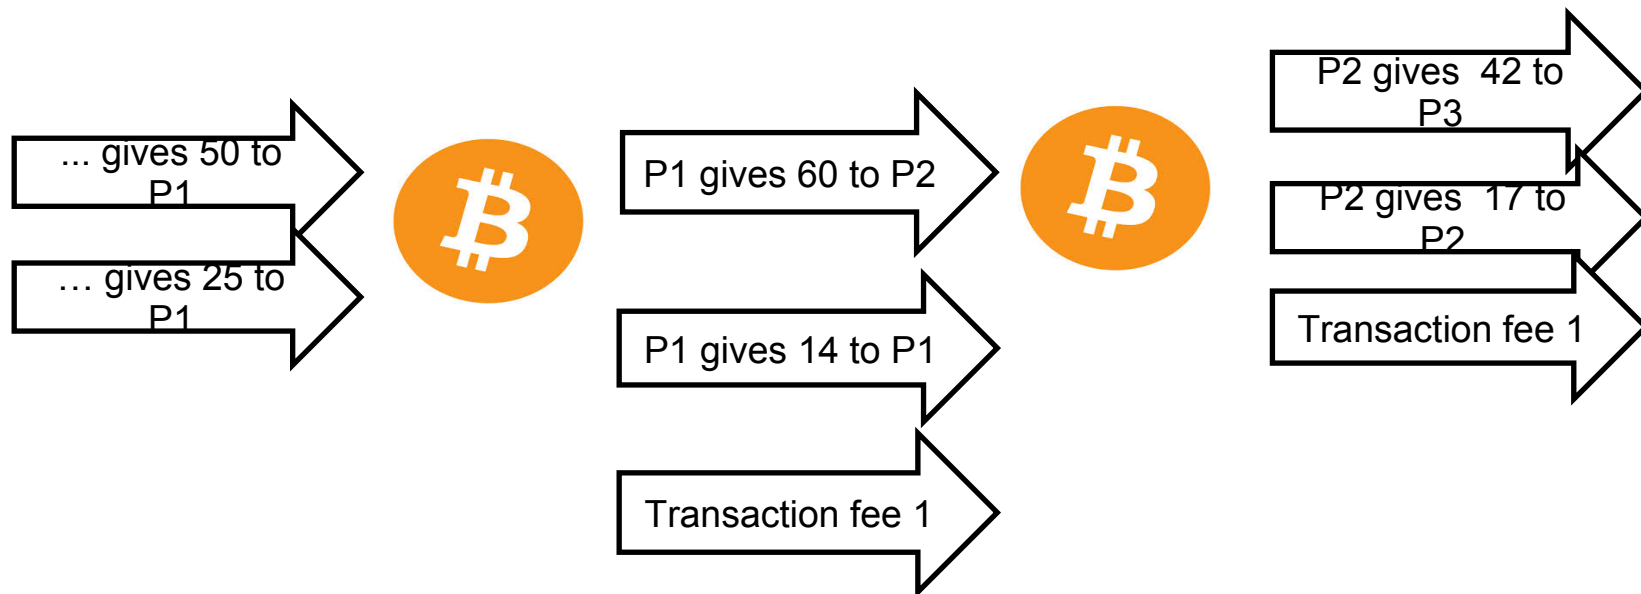

How is money created in Bitcoin?

- New block **every ~10 mins**
 - **d** adjusted every ~2000 blocks
- **H = 2-SHA2**
- **d** number of leading zeros of hash (difficulty)
- **R** random number, **L** new block
- Initial reward: **50 BTC**
 - Halved every ~4 years (now **12.5 BTC**)

How is money transferred in Bitcoin?

Example: P1 wants to give 60 to P2

How is money stored in Bitcoin?

- Transaction in **orphaned blocks** are invalid
 - **Wait 6 blocks** (~1 hour) before accepting transaction.
 - **Checkpoints** to prevent complete history rollback

- **All transaction** are stored in the blockchain
 - (Currently ~170 GB)
